mRNA sequence.
    with a modified polylinker: 1st strand cDNA was prepared from normal prostate bulk tissue, and was then primed with a Not I - oligo(dI) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized, and was constructed by Bento Scares and M. Fatima Bonaldo. **
                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota: Metazoa: Chordata; Craniata: Ver:ebrata: Euteleostcmi: Mammalia: Euthoria: Primates; Catarrhini; Hominidae: Homo.

with a modified polylinker: plasmid DNA from the
normalized library NCI_CGAP_PT2 was prepared, and so
circles were made in vitro. Following HAP purification,
tris DNA was used as tracer in a subtraction; hybridization
reaction. The driver was PCR-amplified cDNAs from a pool
of 5,000 clones made from the same library (clonelDs
98550B-986759, 1101192-1101959, and 1217928-1220615).

The sequence contained an oliqo-dT track that was present in the
oliqooucleofide that was used to prime the synthesis of first
coliqoucleofide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. The sequence tag present in the cDNA between the NoII site
and the oliqo-dI track served to verify it as a clone from the
non-normalized cartilage library cDNA Library Preparation: M.B.
Soares Lab Clone distribution: clones will be available through
Research Genetics (www.resgen.com) The following repetitive
elements were found in this cDNA sequence: 538-616, >Bl_MM*SINE/Alu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /dev_stage="dult"

The sequence contrained an oligo-di track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the Noti site and the cligo-di track served to verify it as a clone from the non-normalized cartilage library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (*ww.resgen.com) The following repetitive elements were found in this cDNA sequence: 539-f17, >81_MM*SINE/Alu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /organism="Rattus norvegicus"

No. is the number of results predicted by chance to hame a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

This sequence was derived from the FAPESP/LICR Human Cancer Genome
Project. This entry can be seen in the following URL
Strand cDNA was primed with oligo (dT)17 on 50 ng of DNAse-treated, total callular RNA obtained from 5,000-10 (OO microdissected, histologically normal prostate epithelial cells. Double-stranded cDNA was ligated to ECORI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Iechnologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BG009951 321 bp mRNA linear EST 24-JAN-200

Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Center clone name: 115_N 17
